## State Pension Age Calculator

### Overview

The State Pension Age Calculator is used to show the client at what age they are eligible for their state pension, under the guidelines set by the current government. These rules are listed on the Government website. This calculator takes the Gender and Date of Birth of the client and uses them to determine and display the age at which the client can begin claiming their state pension.

### Assumptions

Below is a list of all assumptions made in order to perform the calculation:

- Rules are set by the current government (Pensions Act 2014)

### Calculations Breakdown

The calculations require four parameters in order to calculate the given output, these being:

- Gender
- Day of Birth
- Month of Birth
- Year of Birth

The State Pension Age Calculator compares the input data set against a list of pre-determined data sets and selects which set that the input comes under and outputs the subsequent date of the clients' State Pension age.

A PDF report can be created from this calculator which contains detailed information about the relevant client's details and the outputs of the calculations performed.
